Academic Writing in LaTeX: Best and Worst Practices

YEGOR BUGAYENKO

This is a humble attempt to summarize most typical mistakes we make while writing academic papers in Lark and most important recommendations. Each suggestion or a mistake takes a short paragraph of description right here and also may suggest looking into a more detailed explanation in some other online resource. We recommend, before submitting your paper to a conference or a journal, go through this list of mistakes and make sure none of them are present in your paper.

ETEX sources of this document you can find in this GitHub repository and contribute your ideas through a pull request.

Beforehand, we suggest you read these:

• Technical Writing Courses by Google

§1: Check your .tex sources with lacheck and maybe other tools.

1 PREAMBLE

§2: Use <u>acmart</u> document style and read their <u>Best Practices</u>. Start the document with this:

```
| \documentclass[11pt,nonacm,natbib=false] {acmart}
| \settopmatter{printfolios=false,printccs=false,printacmref=false} |
| \usepackage[maxnames=1,minnames=1,natbib=true, |
| citestyle=authoryear,bibstyle=authoryear] {biblatex} |
| \addbibresource{main.bib}
```

§3: Use biblatex and biber, here is why. Place your citations into main.bib file. Later in the document print the bibliography with \printbibliography command.

2 HEADINGS

§4: Capitalize all nouns and verbs in headings, here is why and how.

3 TYPOGRAPHY

§5: Use single dash inside words, e.g.: micro-service. Use double "endash" between numbers, e.g.: pages 15--28. Use triple "emdash" between words avoiding spaces, e.g.: We---since you ask---disagree. Read this.

4 FONTS

§6: Prefer \emph over \textit, here is why.

§7: Avoid \textbf and all other font changing commands at all cost. Here is my rant on this very problem of technical people trying to make their products look visually attractive and failing miserably.

5 COLORS

§8: Don't use them. Keep your documents strictly black-on-white. Read more about this.

6 CODE SNIPPETS

§9: Use ffcode package, which allows writing both code snippets and fixed-width-font in-paragraph text blocks.

7 FIGURES AND TABLES

§10: Don't force positioning in figures and tables, like \begin{table}[h]. Instead, just \begin{table}.

§11: Make sure the explanation you place into \caption is detailed enough to let your reader understand the content without searching the text; see how it's done in this paper.

§12: Prefer a list over a table and a table over a graph.

§13: Align text cells by left, center headings, and align cells with numbers by right (read this discussion); here is a more detailed discussion. Here is an example of a table properly formatted:

```
1 \documentclass{article}
Name
     Age
          Role
                          2 \usepackage[paperwidth=3in]{geometry}
Jeff
          The creator of
                          3 \pagestyle{empty}
          the main
          algorithm and
                          4 \usepackage{booktabs}
          the owner of the
                          5 \usepackage{tabularx}
          code
          The architect of
Sarah
                          6 \begin{document}
          all microservices
                          7 \begin{tabularx}{\columnwidth}
          and the
          developer of
                              {lr>{\raggedright\arraybackslash}X}
          Java modules
                            \toprule
                         10 Name & Age & Role \\
                         11 \midrule
                         12 Jeff & 35 & The creator of the main
                         algorithm and the owner of the code \\
                         14 Sarah & 38 & The architect of all
                         microservices and the developer of
                         16 Java modules \\
                         17 \bottomrule
                         18 \end{tabularx}
```

19 \end{document}

§14: Put all tables into table environment:

```
begin{table}
content goes here
caption{Caption}
label{tab:my-table}
lend{table}
```

§15: In [acmart] document class, use \begin{table*} in order to render it whole-page wide.

8 BULLETS

§16: Prefer in-paragraph itemization over a vertical one and use paralist:

```
1 \documentclass{article}
  The following sources were an-
alyzed: 1) GitHub, 2) Google, and
                           2 \usepackage[paperwidth=3in]{geometry}
3) Stack Overflow.
                           3 \pagestyle{empty}
                           4 \usepackage{paralist}
                           5 \begin{document}
                           6 The following sources were analyzed:
                           7 \begin{inparaenum}[1)]
                           8 \item GitHub,
                           9 \item Google,
                          10 and
                          11 \item Stack Overflow.
                          12 \end{inparaenum}
                          13 \end{document}
```

§17: In all itemization use Oxford comma, as in the list above before the "and" (provided there are more than two items).

9 URLS

§18: Use href-ul package and then \href command.

10 REFERENCES

§19: Don't use \ref, use \cref instead from cleveref package.

11 CITATIONS

§20: This code demonstrates how to use APA-style citations with natbib commands:

In 2004 it was already mentioned by West that object-oriented design is declarative (West, 2004). Later, Bugayenko (2021) suggested a new programming language in this paradigm.

References

 Bugayenko, Yegor (2021). EOLANG and phi-calculus.
 West, David (2004). Object Thinking. Pearson Education.

```
1 \documentclass{article}
2 \usepackage[paperwidth=3in]{geometry}
3 \pagestyle{empty}
4 \usepackage[natbib=true,citestyle=authoryear,
5 bibstyle=authoryear]{biblatex}
6 \addbibresource{main.bib}
7 \begin{document}
8 In \citeyear{west2004} it was already
9 mentioned by \citeauthor{west2004} that
10 object-oriented design is
11 declarative~\citep{west2004}. Later,
12 \citet{eolang2021} suggested a new
13 programming language in this paradigm.
14 \printbibliography
15 \end{document}
```

§21: Place (tilde) symbol before \citep to avoid line breaks, see why.

§22: Prefer \citet over \citep, making references more obvious, as in the second sentence in the example above.

§23: Don't type author names or reference titles directly, only use \cite* commands.

§24: Remember that brackets are not words.

§25: Don't cite Web pages or any other URLs.

§26: Add bibcop to your document, to make sure .bib file is properly formatted.

12 REFERENCES

§27: The references in .bib file are usually imported from Google Scholar or similar sources. Unfortunately, such imports often contain typos and mistakes. Check the items printed in the "References" section for the following:

- Year is not printed twice;
- Dashes in titles are printed as —— without surrounding spaces;
- All nouns and verbs are capitalized in all titles.

 $\S 28$: Use <u>biblint</u> to check your .bib file.
